Side Arms

The standard straight side arms work well for most unscrambling applications. However if you see a number of containers lying on the top of the unscrambler base cabinet, conditions may exist that may have compromised the effectiveness of the straight side arms. They are as follows:

- 1) Improper machine set up
- 2) Containers over 3 inches in diameter
- 3) Containers with noticeable recessed bottoms
- 4) Pucking applications

The “keeper” side arm is designed to provide added control and containment. They are a direct replacement for either sprocket or cam pockets.

Note: Chute pick off area may need to be reworked for side arm clearance. Consult factory.

Toolless Mounting Blocks

Quick release side arms reduce changeover by approximately 50% as compared to the standard fastened side arms. Toolless mounting blocks can be retrofitted in the field by the end user.
